M24C64-R
M24C64-F
M24C64-DF

Features

- Compatible with following I²C bus modes:
  - 1 MHz
  - 400 kHz
  - 100 kHz
- Memory array:
  - 64 Kbit (8 Kbyte) of EEPROM
  - Page size: 32 byte
  - Additional Write lockable page (M24C64-D order codes)
- Single supply voltage:
  - 1.7 V to 5.5 V over –40 °C / +85 °C
  - 1.6 V to 5.5 V over 0 °C / +85 °C
- Write:
  - Byte write within 5 ms
  - Page write within 5 ms
- Random and sequential read modes
- Write protect of the whole memory array
- Enhanced ESD/latch-Up protection
- More than 4 million write cycles
- More than 200-years data retention

Packages

Packages RoHS-compliant and Halogen-free

- SO8N (ECOPACK2)
- TSSOP8 (ECOPACK2)
- UFDFPN (ECOPACK2)
- WLCSP (ECOPACK2)
- Unsawn wafer (each die is tested)

1 Description

The M24C64 is a 64-Kbit I^{2}C-compatible EEPROM (electrically erasable programmable memory) organized as 8K × 8 bits.

Over an ambient temperature range of -40 °C / +85 °C, the M24C64-W can operate with a supply voltage from 2.5 V to 5.5 V, the M24C64-R can operate with a supply voltage from 1.8 V to 5.5 V, and the M24C64-F and M24C64-DF can operate with a supply voltage from 1.7 V to 5.5 V (the M24C64-F can also operate down to 1.6 V, under some restricting conditions).

The M24C64-D offers an additional page, named the identification page (32 byte). The identification page can be used to store sensitive application parameters which can be (later) permanently locked in read-only mode.

2 Signal description

2.1 Serial clock (SCL)

The signal applied on the SCL input is used to strobe the data available on SDA(in) and to output the data on SDA(out).

2.2 Serial data (SDA)

SDA is an input/output used to transfer data in or data out of the device. SDA(out) is an open drain output that may be wired-AND with other open drain or open collector signals on the bus. A pull-up resistor must be connected from serial data (SDA) to V_{CC} (Figure 15 and Figure 16 indicates how to calculate the value of the pull-up resistor).

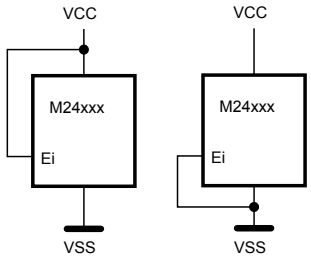

2.3 Chip enable (E2, E1, E0)

(E2, E1,E0) input signals are used to set the value that is to be looked for on the three least significant bits (b3, b2, b1) of the 7-bit device select code (see Table 5. These inputs must be tied to V_{CC} or V_{SS} to establish the device select code as shown in Figure 7. When not connected (left floating), these inputs are read as low (0, 0, 0).

For the 4-balls WLCSP package (see Figure 4), the (E2,E1,E0) inputs are internally connected to (0, 0, 0).

For the 5-balls WLCSP package (see Figure 5), the (E2,E1,E0) inputs are internally connected to (0,0,1).

Figure 7. Chip enable inputs connection

2.4 Write control ($\overline{WC}$)

This input signal is useful for protecting the entire contents of the memory from inadvertent write operations. Write operations are disabled to the entire memory array when write control ($\overline{WC}$) is driven high. Write operations are enabled when write control ($\overline{WC}$) is either driven low or left floating.

When write control ($\overline{WC}$) is driven high, device select and address bytes are acknowledged, data bytes are not acknowledged.

2.5 V_{SS} (ground)

V_{SS} is the reference for all signals, including the V_{CC} supply voltage.

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

2.6 Supply voltage (V_{CC})

2.6.1 Operating supply voltage (V_{CC})

Prior to selecting the memory and issuing instructions to it, a valid and stable V_{CC} voltage within the specified [V_{CC}(min), V_{CC}(max)] range must be applied (see Operating conditions in Section 8 DC and AC parameters). In order to secure a stable DC supply voltage, it is recommended to decouple the V_{CC} line with a suitable capacitor (usually of the order of 10 nF to 100 nF) close to the V_{CC}/V_{SS} package pins.

This voltage must remain stable and valid until the end of the transmission of the instruction and, for a write instruction, until the completion of the internal write cycle (t_W).

2.6.2 Power-up conditions

The V_{CC} voltage has to rise continuously from 0 V up to the minimum V_{CC} operating voltage (see Operating conditions in Section 8 DC and AC parameters).

2.6.3 Device reset

In order to prevent inadvertent write operations during power-up, a power-on-reset (POR) circuit is included.

At power-up, the device does not respond to any instruction until V_{CC} has reached the internal reset threshold voltage. This threshold is lower than the minimum V_{CC} operating voltage (see Operating conditions in Section 8 DC and AC parameters). When V_{CC} passes over the POR threshold, the device is reset and enters the standby power mode; however, the device must not be accessed until V_{CC} reaches a valid and stable DC voltage within the specified [V_{CC}(min), V_{CC}(max)] range (see Operating conditions in Section 8 DC and AC parameters).

In a similar way, during power-down (continuous decrease in V_{CC}), the device must not be accessed when V_{CC} drops below V_{CC}(min). When V_{CC} drops below the power-on-reset threshold voltage, the device stops responding to any instruction sent to it.

2.6.4 Power-down conditions

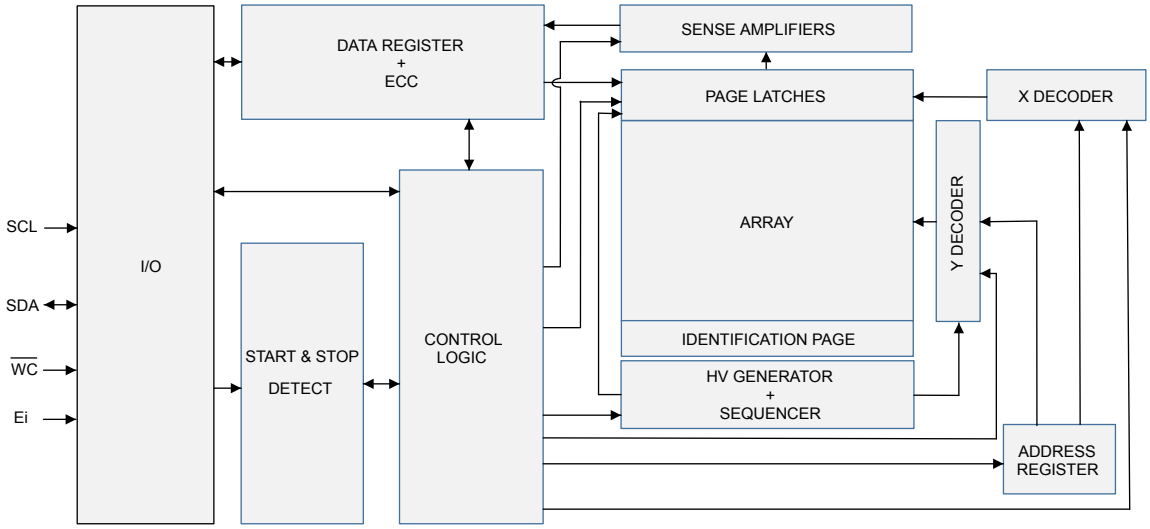

During power-down (continuous decrease in V_{CC}), the device must be in the standby power mode (mode reached after decoding a stop condition, assuming that there is no internal write cycle in progress).

Email:sales@manduic.com

4 Device operation

The device supports the I²C protocol. This is summarized in Figure 9. Any device that sends data on to the bus is defined to be a transmitter, and any device that reads the data to be a receiver. The device that controls the data transfer is known as the bus master, and the other as the slave device. A data transfer can only be initiated by the bus master, which also provides the serial clock for synchronization. The device is always a slave in all communications.

Figure 9. I²C bus protocol

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

4.1 Start condition

Start is identified by a falling edge of serial data (SDA) while serial clock (SCL) is stable in the high state. A start condition must precede any data transfer instruction. The device continuously monitors (except during a write cycle) serial data (SDA) and serial clock (SCL) for a start condition.

4.2 Stop condition

Stop is identified by a rising edge of serial data (SDA) while serial clock (SCL) is stable in the high state. A stop condition terminates communication between the device and the bus master. A read instruction that is followed by NoAck can be followed by a stop condition to force the device into the standby mode.

A stop condition at the end of a write instruction triggers the internal write cycle.

4.3 Data input

During data input, the device samples serial data (SDA) on the rising edge of serial clock (SCL). For correct device operation, serial data (SDA) must be stable during the rising edge of serial clock (SCL), and the serial data (SDA) signal must change only when serial clock (SCL) is driven low.

4.4 Acknowledge bit (ACK)

The acknowledge bit is used to indicate a successful byte transfer. The bus transmitter, whether it be bus master or slave device, releases serial data (SDA) after sending eight bits of data. During the 9^{th} clock pulse period, the receiver pulls serial data (SDA) low to acknowledge the receipt of the eight data bits.

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

4.5 Device addressing

To start communication between the bus master and the slave device, the bus master must initiate a Start condition. Following this, the bus master sends the device select code, shown in Table 5 (most significant bit first).

Table 5. Device select code

	Device type identifier(1)				Chip Enable address(2)			RW
	b7	b6	b5	b4	b3	b2	b1	b0
Device select code when addressing the memory array	1	0	1	0	E2	E1	E0	RW
Device select code when accessing the identification page	1	0	1	1	E2	E1	E0	RW

1. *The MSB, b7, is sent first.*
2. *E0, E1 and E2 are compared with the value read on input pins E0, E1 and E2.*

When the device select code is received, the device only responds if the chip enable address is the same as the value on its chip enable E2,E1,E0 inputs.

The 8th bit is the Read/Write bit ($\overline{RW}$). This bit is set to 1 for read and 0 for write operations.

If a match occurs on the device select code, the corresponding device gives an acknowledgement on serial data (SDA) during the 9th bit time. If the device does not match the device select code, it deselects itself from the bus, and goes into standby mode.

Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

5 Instructions

5.1 Write operations

Following a start condition the bus master sends a device select code with the R/$\overline{W}$ bit (R$\overline{W}$) reset to 0. The device acknowledges this, as shown in Figure 10, and waits for two address byte. The device responds to each address byte with an acknowledge bit, and then waits for the data byte.

Table 6. Most significant address byte

A7	A6	A5	A4	A3	A2	A1	A0

Table 7. Least significant address byte

A7	A6	A5	A4	A3	A2	A1	A0

When the bus master generates a stop condition immediately after a data byte Ack bit (in the “10th bit” time slot), either at the end of a byte write or a page write, the internal write cycle t_W is triggered. A stop condition at any other time slot does not trigger the internal write cycle.

After the stop condition and the successful completion of an internal write cycle (t_W), the device internal address counter is automatically incremented to point to the next byte after the last modified byte.

During the internal write cycle, serial data (SDA) is disabled internally, and the device does not respond to any requests.

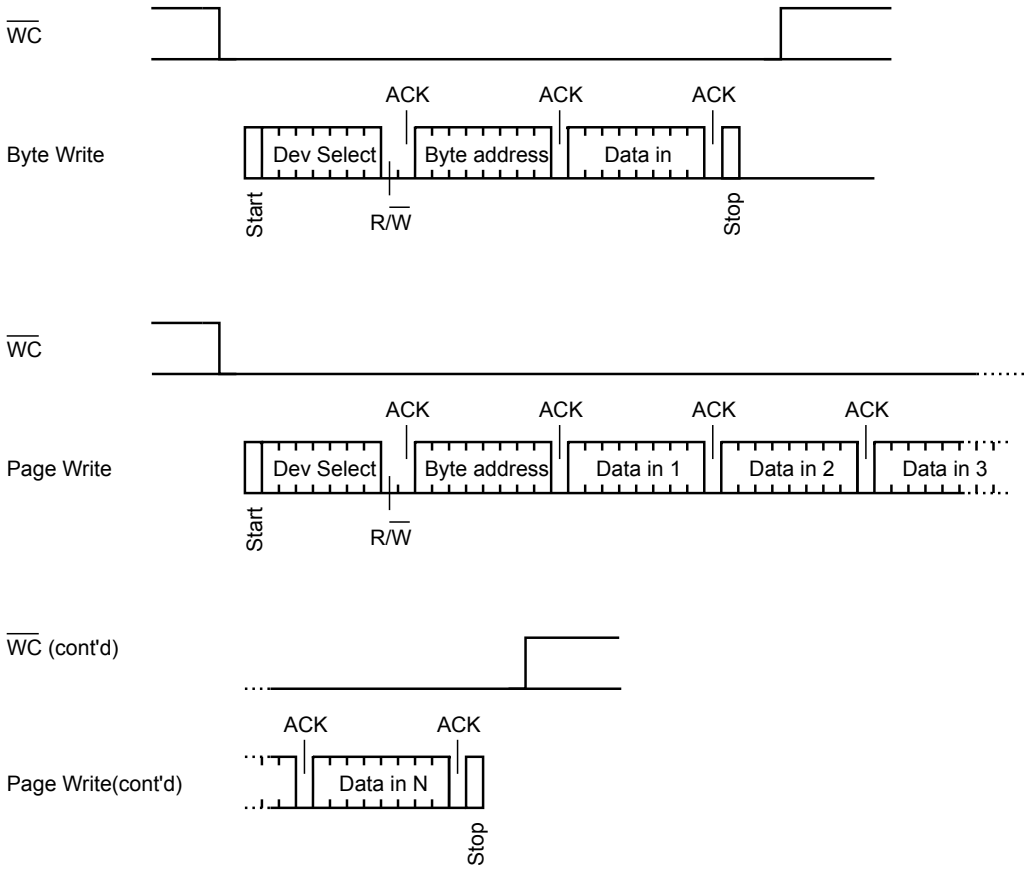

If the write control input ($\overline{WC}$) is driven high, the write instruction is not executed and the accompanying data bytes are *not* acknowledged, as shown in Figure 11.

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

5.1.1 Byte write

After the device select code and the address bytes, the bus master sends one data byte. If the addressed location is write-protected, by write control ($\overline{WC}$) being driven high, the device replies with NoAck, and the location is not modified. If, instead, the addressed location is not write-protected, the device replies with Ack. The bus master terminates the transfer by generating a stop condition, as shown in Figure 10.

Figure 10. Write mode sequences with $\overline{WC}$ = 0 (data write enabled)

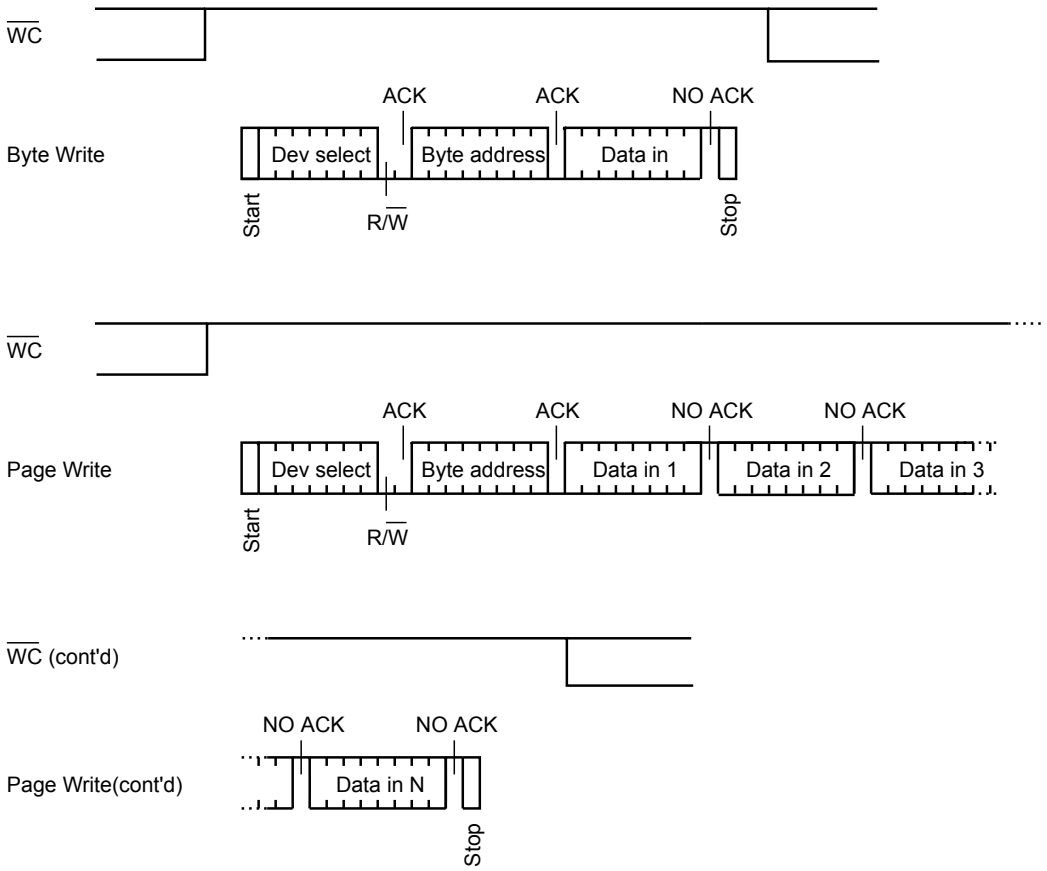

5.1.2 Page write

The page write mode allows up to 32 byte to be written in a single write cycle, provided that they are all located in the same page in the memory: that is, the most significant memory address bits, A15/A5, are the same. If more bytes are sent than fit up to the end of the page, a “roll-over” occurs, i.e. the bytes exceeding the page end are written on the same page, from location 0.

The bus master sends from 1 to 32 byte of data, each of which is acknowledged by the device if write control ($\overline{WC}$) is low. If write control ($\overline{WC}$) is high, the contents of the addressed memory location are not modified, and each data byte is followed by a NoAck, as shown in Figure 11. After each transferred byte, the internal page address counter is incremented.

The transfer is terminated by the bus master generating a stop condition.

Figure 11. Write mode sequences with $\overline{WC}$ = 1 (data write inhibited)

5.1.3 Write identification page (M24C64-D only)

The identification page (32 byte) is an additional page which can be written and (later) permanently locked in read-only mode. It is written by issuing the write identification page instruction. This instruction uses the same protocol and format as page write (into memory array), except for the following differences:

- Device type identifier = 1011b
- MSB address bits A15/A5 are don't care except for address bit A10 which must be ‘0’. LSB address bits A4/A0 define the byte address inside the identification page.

If the identification page is locked, the data bytes transferred during the write identification page instruction are not acknowledged (NoAck).

5.1.4 Lock identification page (M24C64-D only)

The lock identification page instruction (Lock ID) permanently locks the identification page in read-only mode. The lock ID instruction is similar to byte write (into memory array) with the following specific conditions:

- Device type identifier = 1011b
- Address bit A10 must be ‘1’; all other address bits are don't care
- The data byte must be equal to the binary value xxxx xx1x, where x is don't care

5.1.5 ECC (error correction code) and write cycling

The ECC is offered only in devices identified with process letter K, all other devices (identified with a different process letter) do not embed the ECC logic.

The error correction code (ECC) is an internal logic function which is transparent for the I^2C communication protocol.

The ECC logic is implemented on each group of four EEPROM bytes (A group of four bytes is located at addresses [4*N, 4*N+1, 4*N+2, 4*N+3], where N is an integer). Inside a group, if a single bit out of the four bytes happens to be erroneous during a read operation, the ECC detects this bit and replaces it with the correct value. The read reliability is therefore much improved.

Even if the ECC function is performed on groups of four bytes, a single byte can be written/cycled independently. In this case, the ECC function also writes/cycles the three other bytes located in the same group (A group of four bytes is located at addresses [4*N, 4*N+1, 4*N+2, 4*N+3], where N is an integer). As a consequence, the maximum cycling budget is defined at group level and the cycling can be distributed over the 4 bytes of the group: the sum of the cycles seen by byte0, byte1, byte2 and byte3 of the same group must remain below the maximum value defined Table 14.

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

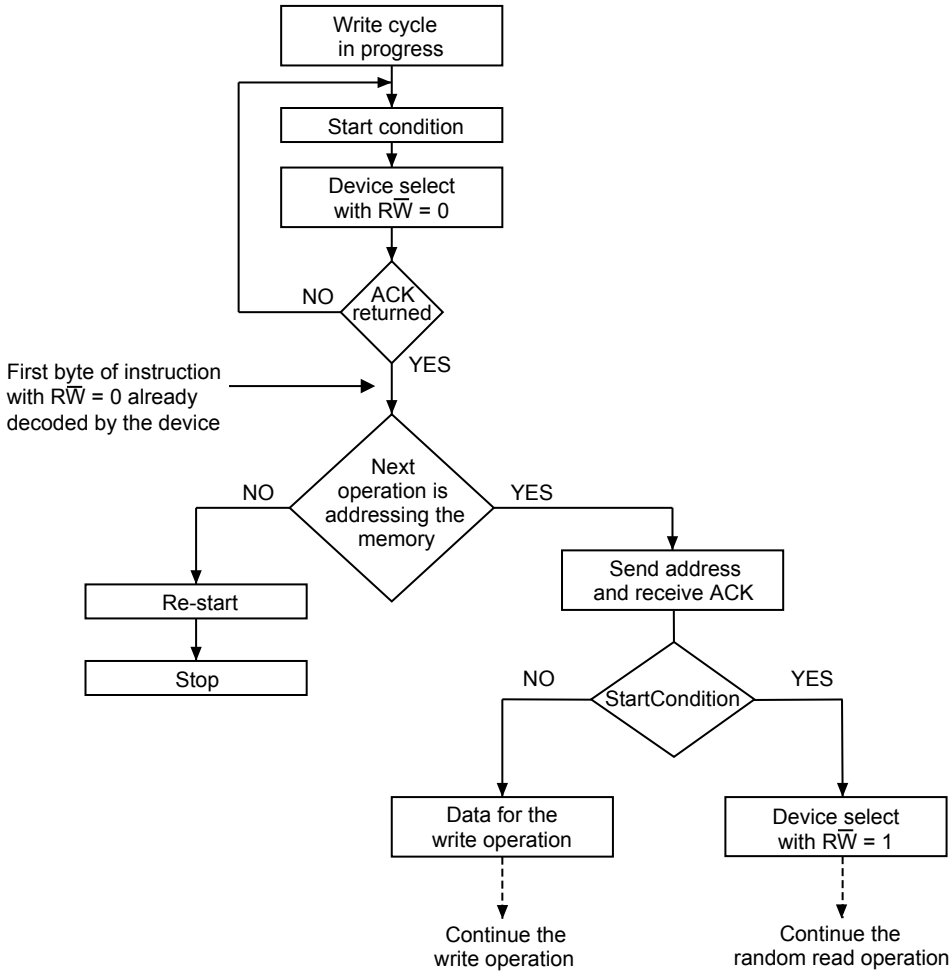

5.1.6 Minimizing write delays by polling on ACK

During the internal Write cycle, the device disconnects itself from the bus, and writes a copy of the data from its internal latches to the memory cells. The maximum write time (t_w) is shown in AC characteristics tables in Section 8 DC and AC parameters, but the typical time is shorter. To make use of this, a polling sequence can be used by the bus master.

The sequence, as shown in Figure 12, is:

- Initial condition: a write cycle is in progress.
- Step 1: the bus master issues a Start condition followed by a device select code (the first byte of the new instruction).
- Step 2: if the device is busy with the internal write cycle, no Ack is returned and the bus master goes back to step 1. If the device has terminated the internal write cycle, it responds with an Ack, indicating that the device is ready to receive the second part of the instruction (the first byte of this instruction having been sent during Step 1).

Figure 12. Write cycle polling flowchart using ACK

1. The seven most significant bits of the device select code of a random read (bottom right box in the Figure 12) must be identical to the seven most significant bits of the device select code of the write (polling instruction in the Figure 12).

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

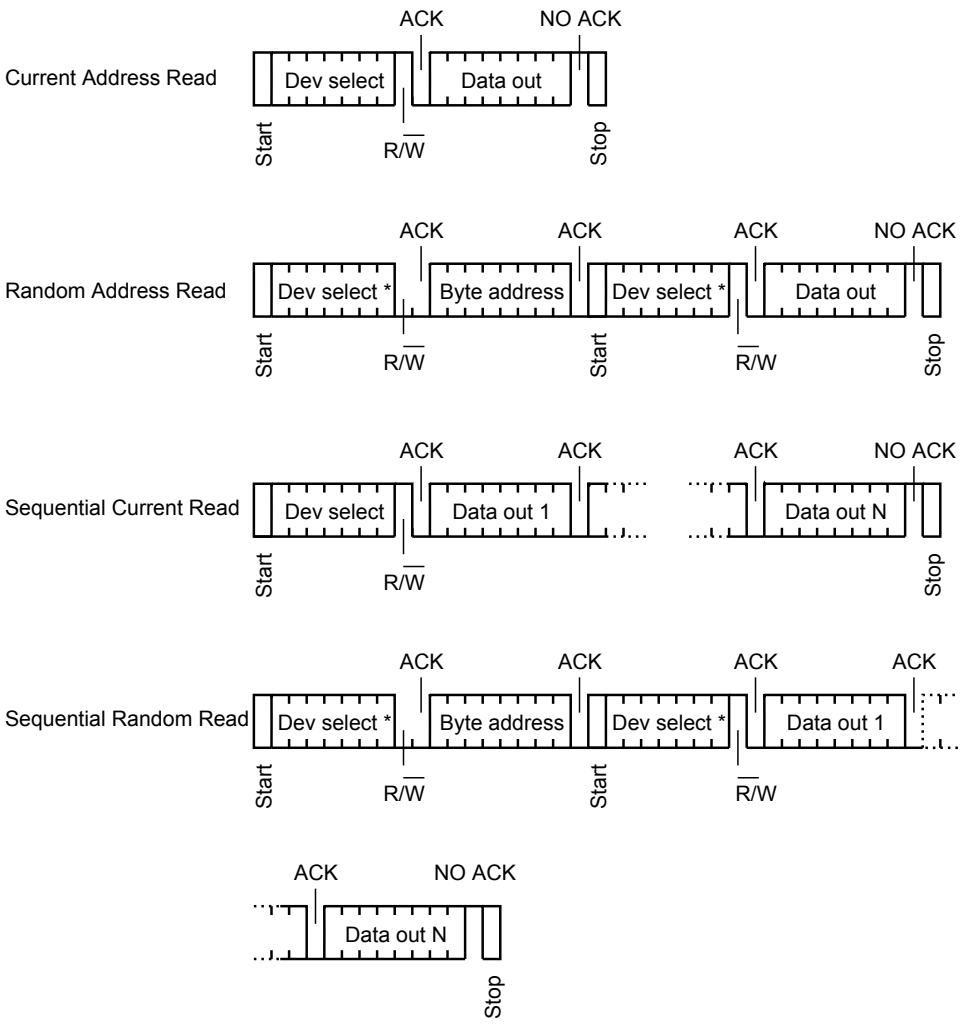

5.2 Read operations

Read operations are performed independently of the state of the write control ($\overline{WC}$) signal.

After the successful completion of a read operation, the device internal address counter is incremented by one, to point to the next byte address.

For the read instructions, after each byte read (data out), the device waits for an acknowledgement (data in) during the 9th bit time. If the bus master does not acknowledge during this 9th time, the device terminates the data transfer and switches to its standby mode after a stop condition.

Figure 13. Read mode sequences

Note: The seven most significant bits of the first device select code of a random read must be identical to the seven most significant bits of the device select code of the write.

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

5.2.1 Random address read

A dummy write is first performed to load the address into this address counter (as shown in Figure 13) but without sending a stop condition. Then, the bus master sends another start condition, and repeats the device select code, with the R$\overline{W}$ bit set to 1. The device acknowledges this, and outputs the contents of the addressed byte. The bus master must not acknowledge the byte, and terminates the transfer with a stop condition.

5.2.2 Current address read

For the current address read operation, following a start condition, the bus master only sends a device select code with the R/W bit set to 1. The device acknowledges this, and outputs the byte addressed by the internal address counter. The counter is then incremented. The bus master terminates the transfer with a stop condition, as shown in Figure 13, without acknowledging the byte.

Note that the address counter value is defined by instructions accessing either the memory or the Identification page. When accessing the Identification page, the address counter value is loaded with the byte location in the Identification page, therefore the next Current Address Read in the memory uses this new address counter value. When accessing the memory, it is safer to always use the Random Address Read instruction (this instruction loads the address counter with the byte location to read in the memory, see Section 5.2.1 Random address read) instead of the Current Address Read instruction.

5.2.3 Sequential read

This operation can be used after a current address read or a random address read. The bus master does acknowledge the data byte output, and sends additional clock pulses so that the device continues to output the next byte in sequence. To terminate the stream of bytes, the bus master must not acknowledge the last byte, and must generate a Stop condition, as shown in Figure 13.

The output data comes from consecutive addresses, with the internal address counter automatically incremented after each byte output. After the last memory address, the address counter “rolls-over”, and the device continues to output data from memory address 00h.

5.2.4 Read identification page (M24C64-D only)

The Identification Page (32 bytes) is an additional page which can be written and (later) permanently locked in Read-only mode.

The identification page can be read by issuing an read identification page instruction. This instruction uses the same protocol and format as the random address read (from memory array) with device type identifier defined as 1011b. The MSB address bits A15/A5 are don't care, the LSB address bits A4/A0 define the byte address inside the identification page. The number of bytes to read in the ID page must not exceed the page boundary (e.g.: when reading the identification page from location 10d, the number of bytes should be less than or equal to 22, as the ID page boundary is 32 bytes).

5.2.5 Read the lock status (M24C64-D only)

The locked/unlocked status of the identification page can be checked by transmitting a specific truncated command [identification page write instruction + one data byte] to the device. The device returns an acknowledge bit if the identification page is unlocked, otherwise a NoAck bit if the identification page is locked.

Right after this, it is recommended to transmit to the device a start condition followed by a stop condition, so that:

- Start: the truncated command is not executed because the start condition resets the device internal logic,
- Stop: the device is then set back into standby mode by the stop condition.

6 Initial delivery state

The device is delivered with all the memory array bits and identification page bits set to 1 (each byte contains FFh).

When delivered in unsawn wafer, all memory bits are set to 1 (each memory byte contains FFh) except the last byte located at address 1FFFh which is written with the value 22h.

7 Maximum rating

Stressing the device outside the ratings listed in Table 8 may cause permanent damage to the device. These are stress ratings only, and operation of the device at these, or any other conditions outside those indicated in the operating sections of this specification, is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 8. Absolute maximum ratings

Symbol	Parameter	Min.	Max.	Unit
-	Ambient operating temperature	-40	130	°C
T_{STG}	Storage temperature	-65	150	°C
T_{LEAD}	Lead temperature during soldering	see note (1)		°C
I_{OL}	DC output current (SDA = 0)	–	5	mA
V_{IO}	Input or output range	-0.50	6.5	V
V_{CC}	Supply voltage	-0.50	6.5	V
V_{ESD}	Electrostatic pulse (human body model)(2)	–	3000(3)	V

1. *Compliant with JEDEC Std J-STD-020 (for small body, Sn-Pb or Pb-free assembly), the ST ECOPACK 7191395 specification, and the European directive on Restrictions of Hazardous Substances (RoHS directive 2011/65/EU of July 2011).*
2. *Positive and negative pulses applied on different combinations of pin connections, according to ANSI/ESDA/JEDEC JS-001 (C1=100 pF, R1=1500 Ω).*
3. *4000 V for devices identified with process letter K.*

Table 16. DC characteristics (M24C64-W)

Symbol	Parameter	Test conditions (in addition to those in Table 9 and Table 12)	Min.	Max.	Unit
I_{LI}	Input leakage current (Ei, SCL, SDA)	$V_{IN} = V_{SS}$ or V_{CC}, device in standby mode	-	± 2	µA
I_{LO}	Output leakage current	SDA in Hi-Z, external voltage applied on SDA: V_{SS} or V_{CC}	-	± 2	µA
I_{CC}	Supply current (Read)	f_C = 400 kHz, 2.5 V ≤ V_{CC} ≤ 5.5 V	-	2	mA
		f_C = 1 MHz, 2.5 V ≤ V_{CC} ≤ 5.5 V	-	2.5	
I_{CC0}(1)	Supply current (Write)	During t_W, 2.5 V ≤ V_{CC} ≤ 5.5 V	-	2.5	mA
I_{CC1}	Standby supply current	Device not selected(2), $V_{IN} = V_{SS}$ or V_{CC}, V_{CC} = 2.5 V	-	2	µA
		Device not selected(2), $V_{IN} = V_{SS}$ or V_{CC}, V_{CC} = 5.5 V	-	3	µA
V_{IL}	Input low voltage (SCL, SDA, $\overline{WC}$,Ei) (3)	-	–0.45	0.3 V_{CC}	V
V_{IH}	Input high voltage (SCL, SDA)	-	0.7 V_{CC}	6.5	V
	Input high voltage ($\overline{WC}$, Ei) (4)	-	0.7 V_{CC}	V_{CC}+ 0.6	
V_{OL}	Output low voltage	I_{OL} = 2.1 mA, V_{CC} = 2.5 V or I_{OL} = 3 mA, V_{CC} = 5.5 V	-	0.4	V

1. *Evaluated by characterization - Not tested in production.*
2. *The device is not selected after power-up, after a read instruction (after the stop condition), or after the completion of the internal write cycle t_W (t_W is triggered by the correct decoding of a write instruction).*
3. *Ei inputs should be tied to V_{SS} (see Section 2.3 Chip enable (E2, E1, E0)).*
4. *Ei inputs should be tied to V_{CC} (see Section 2.3 Chip enable (E2, E1, E0))*

Table 17. DC characteristics (M24C64-R)

Symbol	Parameter	Test conditions(1) (in addition to those in Table 10)	Min.	Max.	Unit
I_{LI}	Input leakage current (Ei, SCL, SDA)	V_{IN} = V_{SS} or V_{CC}, device in standby mode	-	± 2	µA
I_{LO}	Output leakage current	SDA in Hi-Z, external voltage applied on SDA: V_{SS} or V_{CC}	-	± 2	µA
I_{CC}	Supply current (Read)	V_{CC} = 1.8 V, f_c= 400 kHz	-	0.8	mA
		f_c= 1 MHz	-	2.5	
I_{CC0}(2)	Supply current (Write)	During t_W, 1.8 V ≤ V_{CC} ≤ 2.5 V	-	1.5	mA
I_{CC1}	Standby supply current	Device not selected,(3) V_{IN} = V_{SS} or V_{CC}, V_{CC} = 1.8 V	-	1	µA
V_{IL}	Input low voltage (SCL, SDA, $\overline{WC}$, Ei) (4)	1.8 V ≤ V_{CC} ≤ 2.5 V	-0.45	0.25 V_{CC}	V
V_{IH}	Input high voltage (SCL, SDA)	1.8 V ≤ V_{CC} < 2.5 V	0.75 V_{CC}	6.5	V
	Input high voltage ($\overline{WC}$, Ei) (5)	1.8 V ≤ V_{CC} < 2.5 V	0.75 V_{CC}	V_{CC} + 0.6	V
V_{OL}	Output low voltage	I_{OL} = 1 mA, V_{CC} = 1.8 V	-	0.2	V

1. *If the application uses the voltage range R device with 2.5 V ≤ Vcc ≤ 5.5 V and -40 °C < TA < +85 °C, refer to Table 16 instead of this table.*
2. *Evaluated by characterization - Not tested in production.*
3. *The device is not selected after power-up, after a read instruction (after the stop condition), or after the completion of the internal write cycle t_W (t_W is triggered by the correct decoding of a write instruction).*
4. *Ei inputs should be tied to V_{SS} (see Section 2.3 Chip enable (E2, E1, E0))*
5. *Ei inputs should be tied to V_{CC} (see Section 2.3 Chip enable (E2, E1, E0))*

Table 19. 400 kHz AC characteristics

Symbol	Alt.	Parameter	Min.	Max.	Unit
f_C	f_{SCL}	Clock frequency	-	400	kHz
t_{CHCL}	t_{HIGH}	Clock pulse width high	600	-	ns
t_{CLCH}	t_{LOW}	Clock pulse width low	1300	-	ns
t_{QL1QL2}(1)	t_F	SDA (out) fall time	20(2)	300	ns
t_{XH1XH2}	t_R	Input signal rise time	(3)	(3)	ns
t_{XL1XL2}	t_F	Input signal fall time	(3)	(3)	ns
t_{DXCH}	$t_{SU:DAT}$	Data in set up time	100	-	ns
t_{CLDX}	$t_{HD:DAT}$	Data in hold time	0	-	ns
t_{CLQX}(4)	t_{DH}	Data out hold time	50	-	ns
t_{CLQV}(5)	t_{AA}	Clock low to next data valid (access time)	-	900	ns
t_{CHDL}	$t_{SU:STA}$	Start condition setup time	600	-	ns
t_{DLCL}	$t_{HD:STA}$	Start condition hold time	600	-	ns
t_{CHDH}	$t_{SU:STO}$	Stop condition set up time	600	-	ns
t_{DHDL}	t_{BUF}	Time between Stop condition and next Start condition	1300	-	ns
t_{WLDL}(1)(6)	tSU:WC	$\overline{WC}$ set up time (before the start condition)	0	-	µs
t_{DHWH}(1)(7)	tHD:WC	WC hold time (after the stop condition)	1	-	
t_W	t_{WR}	Write time	-	5	ms
t_{NS}(1)	-	Pulse width ignored (input filter on SCL and SDA) - single glitch	-	50	ns

1. *Evaluated by characterization - Not tested in production.*
2. *With C_L = 10 pF.*
3. *There is no min. or max. values for the input signal rise and fall times. It is however recommended by the I²C specification that the input signal rise and fall times be more than 20 ns and less than 300 ns when f_C < 400 kHz.*
4. *To avoid spurious start and stop conditions, a minimum delay is placed between SCL=1 and the falling or rising edge of SDA.*
5. *t_{CLQV} is the time (from the falling edge of SCL) required by the SDA bus line to reach either 0.3 V_{CC} or 0.7 V_{CC}, assuming that R_{bus} × C_{bus} time constant is within the values specified in Figure 15.*
6. *$\overline{WC}$=0 set up time condition to enable the execution of a WRITE command*
7. *$\overline{WC}$=0 hold time condition to enable the execution of a WRITE command.*

9 Package information

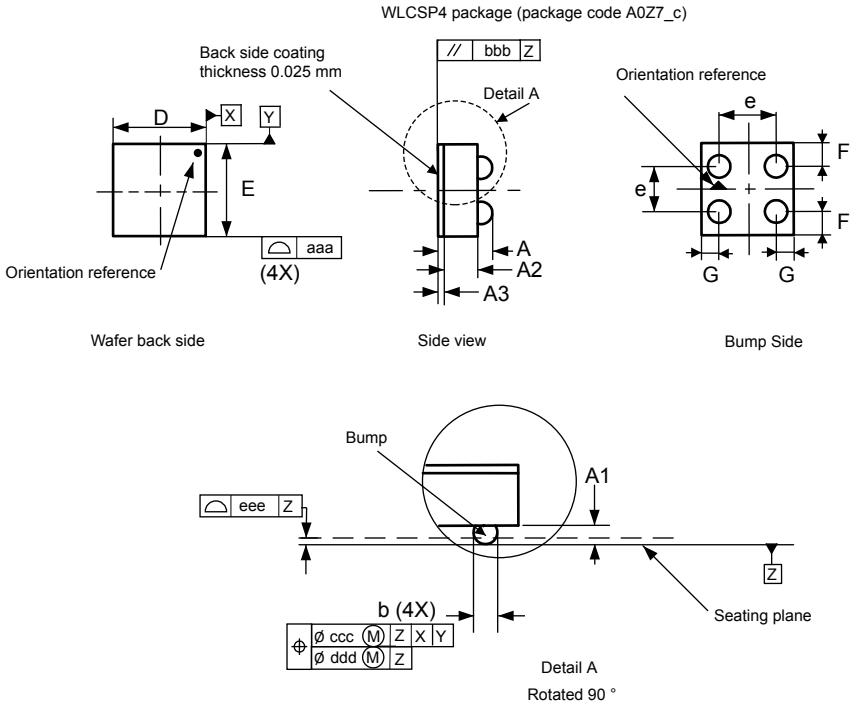

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: www.st.com.

ECOPACK is an ST trademark.

9.1 WLCSP4 (CU) ultra thin package information

This WLCSP4 is a 4-bump, 0.795 x 0.674 mm, 0.400 mm pitch, ultra thin wafer level chip scale package.

Figure 18. WLCSP4 (CU) - Outline

1. Drawing is not to scale.
2. Primary datum Z and seating plane are defined by the spherical crowns of the bump.
3. Bump position designation per JESD 95-1, SPP-010.

9.3 UFDFPN5 (DFN5) package information

UFDFPN5 is a 5-lead, 1.7 × 1.4 mm, 0.55 mm thickness, ultra thin fine pitch dual flat package.

Figure 22. UFDFPN5 - Outline

1. Maximum package warpage is 0.05 mm.
2. Exposed copper is not systematic and can appear partially or totally according to the cross section.
3. Drawing is not to scale.
4. On the bottom side, pin 1 is identified by the specific pad shape and, on the top side, pin 1 is defined from the orientation of the marking. When reading the marking, pin 1 is below the upper left package corner.

Table 23. UFDFPN5 - Mechanical data

3. *Dimension “E1” does not include interlead flash or protrusions. Interlead flash or protrusions shall not exceed 0.25 mm per side.*

Note: The package top may be smaller than the package bottom. Dimensions D and E1 are determinated at the outermost extremes of the plastic body exclusive of mold flash, tie bar burrs, gate burrs and interleads flash, but including any mismatch between the top and bottom of plastic body. Measurement side for mold flash, protusions or gate burrs is bottom side.

10 Ordering information

Table 28. Ordering information scheme

Example:	M24	C64	-D	W	MC	6	T	P	/T	F
Device type										
M24 = I²C serial access EEPROM										
Device function										
C64 = 64 Kbit (8192 x 8 bit)										
Device family										
Blank = Without identification page										
D = With identification page										
Operating voltage										
W = V_{CC} = 2.5 V to 5.5 V										
R = V_{CC} = 1.8 V to 5.5 V										
F = V_{CC} = 1.6 V or 1.7 V to 5.5 V										
Package(1)										
MN = SO8N (150 mil width)										
DW = TSSOP8 (169 mil width)										
MC = UFDFPN8 (DFN8)										
CT = 8-bump WLCSP										
MH = UFDFPN5 (DFN5)										
CS = 5-bump WLCSP										
CU = 4-bump WLCSP										
Device grade										
6 = Industrial: device tested with standard test flow over -40 to 85 °C										
Option										
T = Tape and reel packing										
blank = tube packing										
Plating technology										
P or G = RoHS compliant and halogen-free (ECOPACK2)										
Process(2) **or Packing option**										
/K or /T = Manufacturing technology code										
/12 = Packing 12 mm tape										
Option										
Blank = No back side coating										
F = Back side coating										

1. *All packages are ECOPACK2 (RoHS-compliant and free of brominated, chlorinated and antimony-oxide flame retardants).*
2. *These process letters appear on the device package (marking) and on the shipment box. Contact your nearest ST Sales Office for further information.*

Table 29. Ordering information scheme (unsawn wafer)

Example:[1]	M24	C64 -	F	T	W	20	I	/90
Device type								
M24 = I^2C serial access EEPROM								
Device function								
C64 = 64 Kbit (8192 x 8 bit)								
Operating voltage								
F = V_{CC} = 1.7 V to 5.5 V								
Process								
T = F8H+								
Delivery form								
W =Wafer (bare die)								
Wafer thickness								
20 = Non-backlapped wafer								
Wafer testing								
I = Inkless test								
Device grade								
90 = -40°C to 85°C								

1. *For all information concerning the M24C64 delivered in unsawn wafer, contact your nearest ST Sales Office.*

Note: For a list of available options (memory, package, and so on) or for further information on any aspect of this device, contact your nearest ST sales office.

Note: Parts marked as “ES”, “E” or accompanied by an Engineering Sample notification letter, are not yet qualified and therefore not approved for use in production. ST is not responsible for any consequences resulting from such use. In no event will ST be liable for the customer using any of these engineering samples in production. ST Quality has to be contacted prior to any decision to use these Engineering samples to run qualification activity.

Revision history

Table 30. **Document revision history**

Date	Revision	Changes
14-Mar-2011	22	Updated information concerning E2, E1, E0 for the WLCSP package: • note under *Figure 3: UFDFPN5 package connections* • comment under *Figure 7:Chip enableinputs connection* • note 3 under *Table 2: Device select code*
07-Apr-2011	23	Updated MLP8 package data and *Section 10: Part numbering*Added footnote (a) in *Section 4.5: Memory addressing*.
18-May-2011	24	Updated: • *Figure3:UFDFPN5 package connections* • *Table 6:Absolute maximum ratings* • *Smalltextchanges* Added: • *Figure12:Memory cellcharacteristics*
08-Sep-2011	25	Updated: • *Table22: UFDFPN8 (MLP8) – 8-lead ultra thin fine pitch dualflat no lead, 2 x 3 mm, data* • *Figure16:MaximumRbusvalueversus busparasitic capacitance Cbus) for an I2Cbus at maximumfrequencyfC= 1MHz* • *Figure6: I2CFastmode Plus (fC =1 MHz): maximumRbus value versus busparasiticcapacitance(Cbus).* Added tWLDL and tDHWH in: • *Table17: 400 kHz ACcharacteristics* • *Table18: 1 MHzAC characteristics* • *Figure:* Minor text changes.
16-Dec-2011	26	Updated Adimension in *Table 25: WLCSP- 5-bump, 0.959 x1.073 mm, 0.4mmpitch wafer level chipscale packagemechanicaldata*.
28-Aug-2012	27	Datasheet split into: • M24C64-DF, M24C64-W, M24C64-R,M24C64-F (this datasheet) forstandard products (range 6), • M24C64-125 datasheet for automotive products (range 3). Added 8-bump thin WLCSP. Updated • single supply voltage and number of Write cycles on cover page. • Section 2.1: Serial Clock (SCL) and Section 2.2: Serial Data (SDA). • Figure 8, Figure 11 • Section 5.1.5: ECC (Error Correction Code)and Write cycling and Section 5.1.6: Minimizing Write delays by polling on ACK. Section 5.1.2: Page Write. Section 5.1.4: Lock Identification Page (M24C64-D only). Section 5.1: Write operations • Table 13, Table 27 Added: • Table12 • note 1in Table 7 and Table 8: • Section 4.5: Device addressing, Moved Figure 10 to Section 5.1.1: Byte Write Removed note 2 in Table 17
18-Nov-2013	28	Updated: • Chapter 5.2.2: Current Address Read,

深圳市满度科技有限公司

Email:sales@manduic.com

Date	Revision	Changes
		• Table14, Table 15, Table 25 • Figure 19, Figure 24., Figure 26 Added note (1) under Table 6. Removed note (3) in Table 3.
21-Jul-2014	29	Updated Figure 3, Figure 6, Table 15, Table 9, Table 17, Table 18 and Table 27. Table 18 and Figure 18 related to UFDFPN5 package. Section 5.1.5 Updated ECOPACK info on front page. Updated notes: • (1) on Table 7, Table 8, Table 14, Table 18, (8) on Table 15, (2) on Table 16, (3) on Table 27, (2) merged with (3) on Table 15, (1) on Table 9 Added: • supply voltage level specification on Cover page • package UFDFPN5 on Cover page
12-Nov-2014	30	Added: • note 2 on Table 14, note 2 on DW, MC and CS package on Table 27, note 1 on BN package on Table 27 • Figure 3 Updated: • Section1: Description, Chapter5.1.5, Table 14, Table 15, Table 16 • note 3 on Table 6, note 1 on Table 9, note 1 on Table 12, note 1 on Table 13, note 2 on Table 27
30-Jul-2015	31	Added WLCSP package. Updated Table 27.
18-Feb-2016	32	Updated Figure 4, Figure 18,Table 19 and added Table 2
22-Jun-2016	33	Added Reference to unsawn wafer inside cover page and added Table 28: Ordering information scheme (unsawn wafer)
13-Sep-2017	34	Added reference to DFN8 and DFN5 in: cover page figure, Figure 3, Section 9.1: UFDFPN5 (DFN5) package information, Section 9.2: UFDFPN8 (DFN8) package information and Table 29: Ordering information scheme. Added Figure 19. Updated Table 28
16-Nov-2017	35	Updated Table 29: Ordering information scheme
14-Mar-2018	36	Added Table 3:WLCSP 5-bumpsignals vs.bump position, Table 4: WLCSP 8-bump signals vs bump position Updated Figure 6: WLCSP 8-bump thin connections(M24C64- DFCT6TP/K)
28-Jul-2022	37	Updated: • Section Features, Section 2.2 Serial data (SDA), Section 3 Block diagram, Section 4.2 Stop condition, Section 9 Package information with all its subsection • added note in Figure 13 • Table 8, Table 9, Table 10, Table 13, Table 14, Table 15, Table 16. DC characteristics (M24C64-W), Table 17, Table 18, Table 19, Table 20, Table 28 Removed any reference to package PDIP8
