P24C08D/P24C16D

I²C-Compatible Serial E²PROM

Datasheet V1.5

General Description

The P24C08D/P24C16D is I²C-compatible Serial EEPROM (Electrically Erasable Programmable Memory) device. It contains a memory array of 8 Kbits (1 Kbytes)/16 Kbits (2 Kbytes), which is 16 bytes per page.

Features

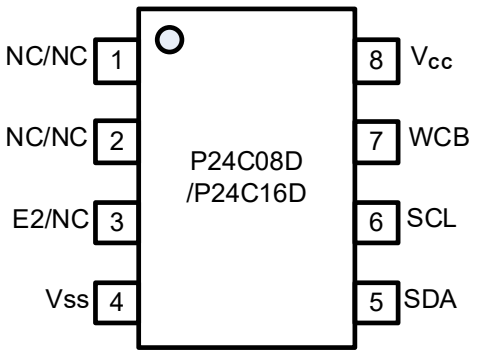

- Single Supply Voltage and High Speed Mode
  - ✧ Minimum operating voltage down to 1.7 V
  - ✧ 400 kHz/1 MHz clock from 1.7V to 5.5 V
- Low power CMOS technology
  - ✧ Read current 0.2 mA (400 kHz, typical)
  - ✧ Write current 0.8 mA (400 kHz, typical)
- Schmitt Trigger, Filtered Inputs for Noise Suppression
- Sequential & Random Read Features
- Page Write Modes, Partial Page Writes Allowed
- Write protect of the whole memory array
- Additional Write Lockable Page and 128 bits Serial Number
- Self-timed Write Cycle (5 ms maximum)
- High Reliability
  - ✧ Endurance: 1 Million Write Cycles
  - ✧ Data Retention: 100 Years
  - ✧ HBM: 4 kV
  - ✧ Latch up Capability: +/-200 mA(25 C)
- Package: PDIP8, SOP8(150mil), TSSOP8, SOT23-5, TSOT23-5, UDFN8, MSOP8

PUYA CONFIDENTIAL

1.3 Pin Descriptions

Serial Clock (SCL): The SCL input is used to positive-edge clock data in and negative-edge clock data out of each device.

Serial Data (SDA): The SDA pin is bidirectional for serial data transfer. This pin is open drain driven and may be wire-OR'ed with any number of other open-drain or open-collector devices.

Write Control (WCB): The Write Control input, when WCB is connected directly to V_{cc}, all write operations to the memory are inhibited. When connected to Vss, allows normal write operations. If the pin is left floating, the WCB pin will be internally pulled down to Vss.

Device Addresses (E2): The E2 pin is device address inputs. Typically, the E2 pin is for hardware addressing and a total of 2 devices can be connected on a single bus system. If these pins are left floating, the E2 pin will be internally pulled down to Vss, and the corresponding device address is fixed to 0.

Supply Voltage(V_{cc}): V_{cc} is the supply voltage.

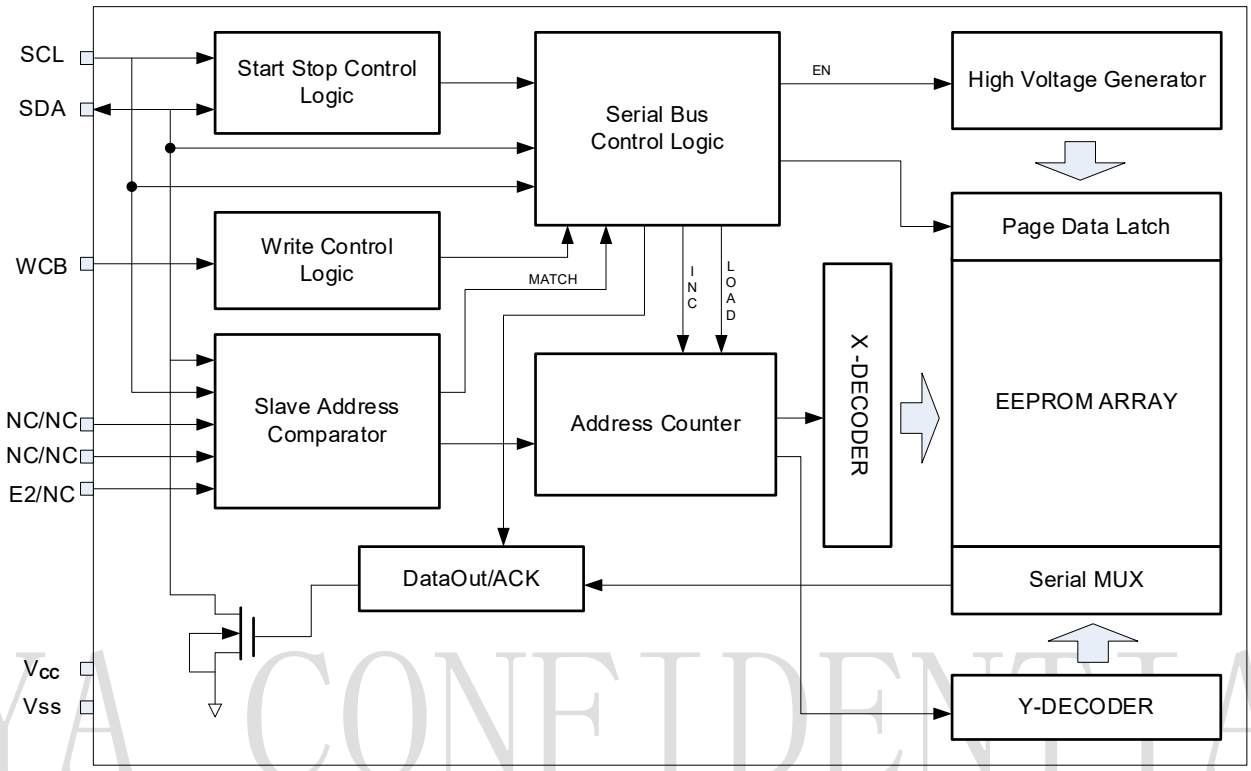

Ground(Vss): Vss is the reference for the V_{cc} supply voltage.

3. Electrical Characteristics

Table 3-1 Absolute Maximum Ratings [1]

Symbol	Parameter	Min.	Max.	Units
T_{STG}	Storage Temperature	-65	150	°C
T_A	Ambient operating temperature	-40	85	°C
V_{CC}	Supply Voltage	-0.5	6.5	V
V_{IO}	Input or output range	-0.5	6.5	V
I_{OL}	DC output current (SDA=0)	-	5	mA

Note: [1] Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 3-2 Pin Capacitance [1]

Symbol	Parameter	Max.	Units	Test Condition
$C_{I/O}$	Input / Output Capacitance (SDA)	8	pF	$V_{I/O}$= Vss
C_{IN}	Input Capacitance (WCB, SCL)	6	pF	V_{IN}= Vss

Note: [1] Test Conditions: T_A = 25°C, f_{SCL} = 1MHz, Vcc = 5.0V.

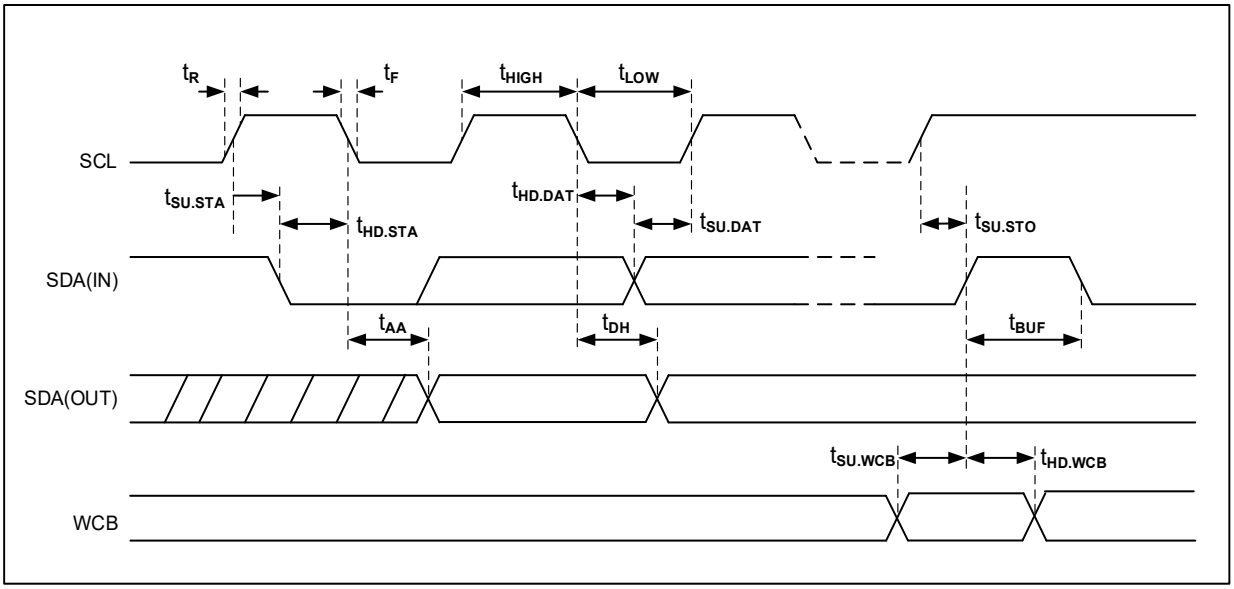

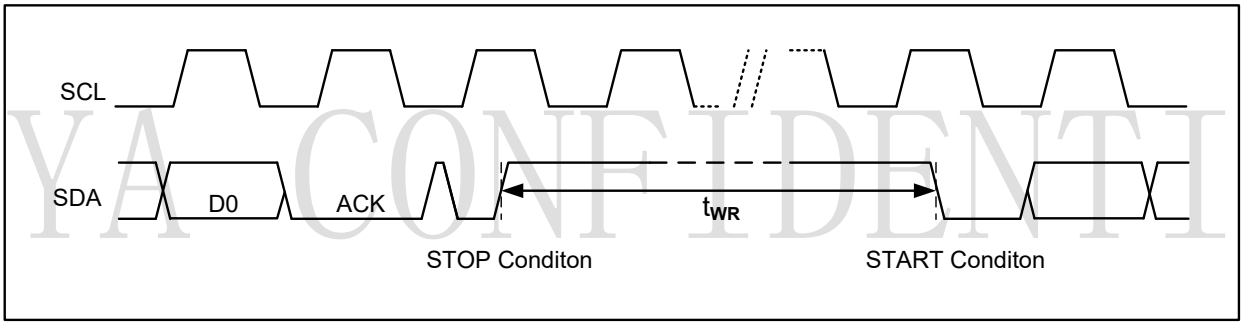

Figure 3-2 Write Cycle Timing

PUYA CONFIDENTIAL

Note: [1] The write cycle time t_{WR} is the time from a valid stop condition of a write sequence to the end of the internal clear/write cycle.

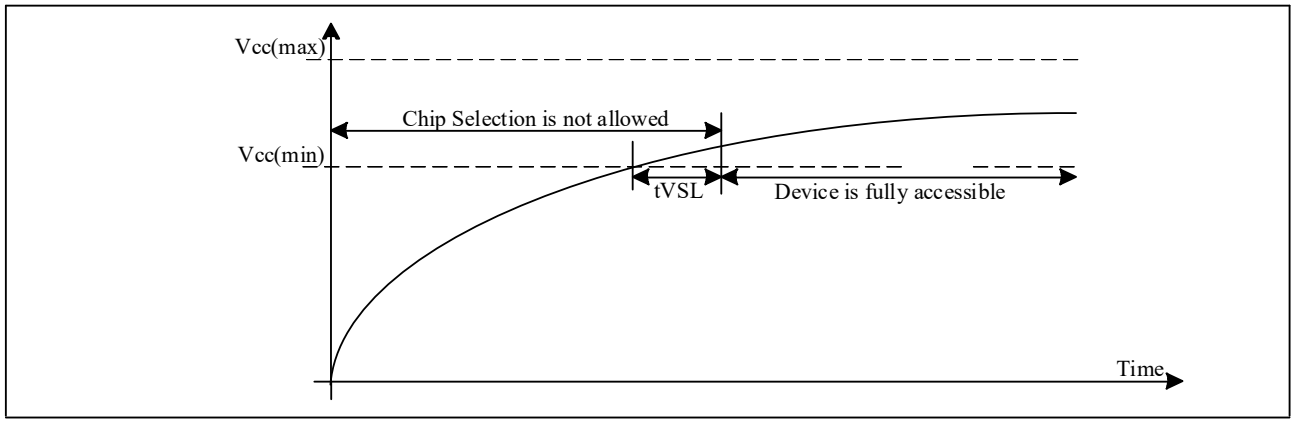

Device Power-Up

The EEPROM has a built-in power-on-reset circuit that initializes itself at the same time during power-on. Unsuccessful initialization may cause a malfunction. To operate the power-on-reset circuit normally, the following conditions must be satisfied to raise the power supply voltage.

When initialization is successfully completed by the power-on-reset circuit, the EEPROM enters the standby status. tVSL is the time required to initialize the EEPROM. No instructions are accepted during this time.

4. Device Operation

4.1 Data Input

The SDA pin is normally pulled high with an external device. Data on the SDA pin may change only during SCL low time periods (see to Figure 4-1). Data changes during SCL high periods will indicate a start or stop condition as defined below.

Figure 4-1 Data Validity

PUYA CONFIDENTIAL

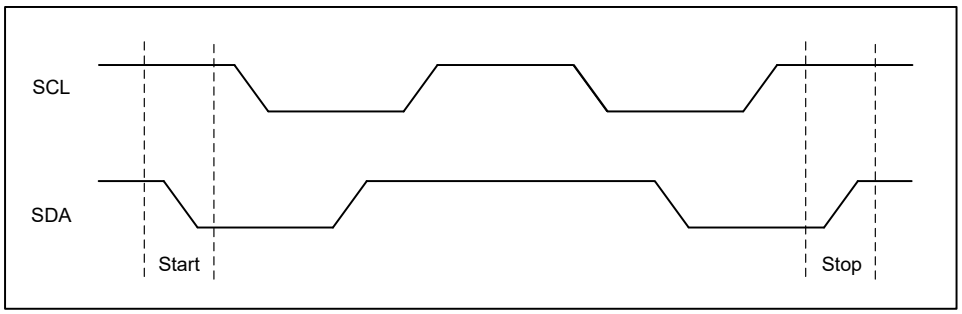

4.2 Start Condition

A high-to-low transition of SDA with SCL high is a start condition which must precede any other command (see to Figure 4-2).

4.3 Stop Condition

A low-to-high transition of SDA with SCL high is a stop condition. After a read sequence, the stop command will place the P24C08D/P24C16D in a standby mode (see Figure 4-2).

Figure 4-2 Start and Stop Definition

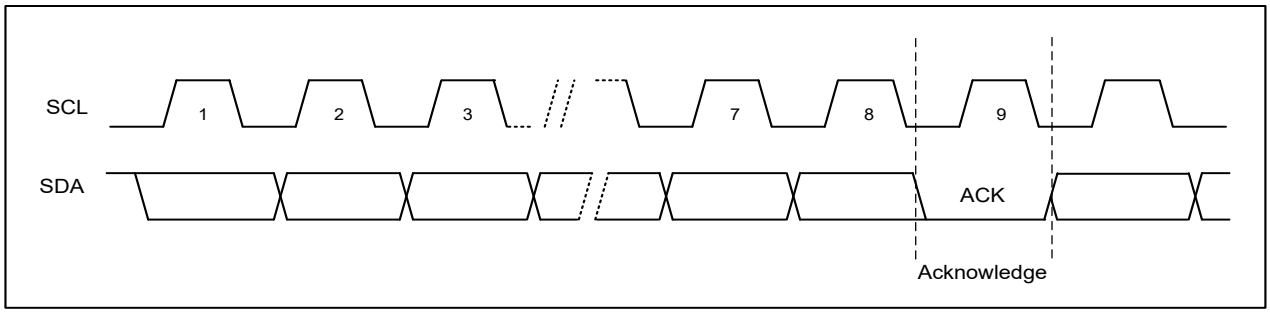

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

4.4 Acknowledge (ACK)

All addresses and data words are serially transmitted to and from the P24C08D/P24C16D in 8-bit words. The P24C08D/P24C16D sends a “0” to acknowledge that it has received each word. This happens during the ninth clock cycle.

Figure 4-3 Output Acknowledge

4.5 Standby Mode

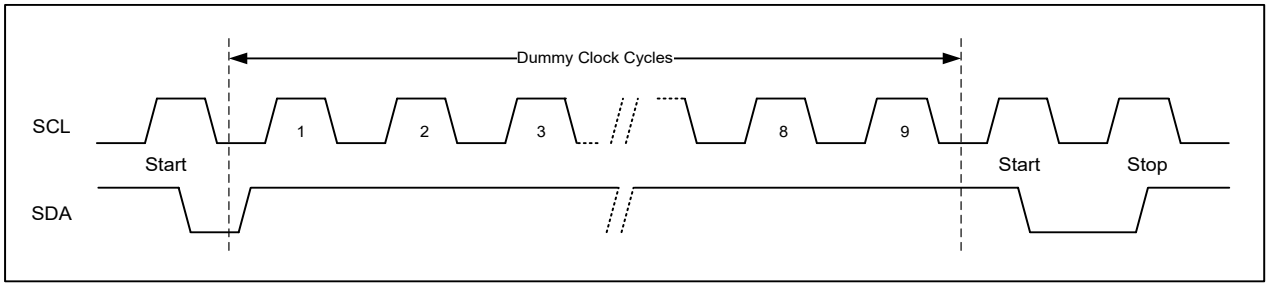

The P24C08D/P24C16D features a low-power standby mode which is enabled: (a) after a fresh power up, (b) after receiving a STOP bit in read mode, and (c) after completing a self-time internal programming operation

PUYA CONFIDENTIAL

4.6 Soft Reset

After an interruption in protocol, power loss or system reset, any two-wire part can be reset by following these steps: (a) Create a start condition, (b) Clock nine cycles, and (c) create another start bit followed by stop bit condition, as shown below. The device is ready for the next communication after the above steps have been completed.

Figure 4-4 Soft Reset

4.7 Device Addressing

The P24C08D/P24C16D requires an 8-bit device address word following a start condition to enable the chip for a read or write operation (see table below). The device address word consists of a mandatory one-zero sequence for the first four most-significant bits, as shown.

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

Table 4-1 Device Address

Chip	Access area	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
P24C08D	Normal Area	1	0	1	0	E2	A9	A8	R/W
	ID Page	1	0	1	1	E2	X	X	R/W
	Lock Bit	1	0	1	1	E2	X	X	R/W
	Serial Number	1	0	1	1	E2	X	X	1
P24C16D	Normal Area	1	0	1	0	A10	A9	A8	R/W
	ID Page	1	0	1	1	X	X	X	R/W
	Lock Bit	1	0	1	1	X	X	X	R/W
	Serial Number	1	0	1	1	X	X	X	1

Table 4-2 Word Address

Chip	Data	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
P24C08D P24C16D	Normal Area	A7	A6	A5	A4	A3	A2	A1	A0
	ID Page	0	0	X	X	A3	A2	A1	A0
	Lock Bit	X	1	X	X	X	X	X	X
	Serial Number	1	0	X	X	A3	A2	A1	A0

The E2 device address bits to allow as many as two devices on the same bus. These bits must compare to their corresponding hardwired input pins. The E2 pin uses an internal proprietary circuit that biases it to a logic low condition if the pin is floating. The eighth bit of the device address is the read/write operation select bit. A read operation is initiated if this bit is high and a write operation is initiated if this bit is low. Upon a compare of the device address, the Chip will output a zero. If a compare is not made, the device will return to a standby state.

PUYA CONFIDENTIAL

4.8 Data Security

The P24C08D/P24C16D has a hardware data protection scheme that allows the user to write protect the whole memory when the WCB pin is at Vcc.

Tel:150-1290-5940
Email:sales@manduic.com

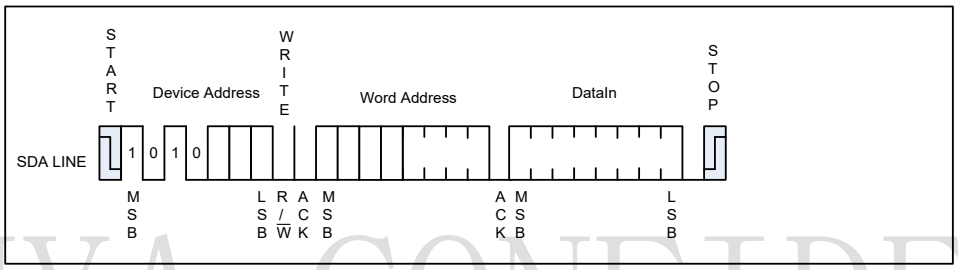

5. Instructions

5.1 Write Operations

5.1.1 Byte Write

A write operation requires one 8-bit data word address following the device address word and acknowledgment. Upon receipt of this address, the P24C08D/P24C16D will again respond with a “0” and then clock in the first 8-bit data. Following receipt of the 8-bit data word, the P24C08D/P24C16D will output a “0” and the addressing device, such as a microcontroller, must terminate the write sequence with a stop condition. And then the P24C08D/P24C16D enters an internally timed write cycle, all inputs are disabled during this write cycle and the P24C08D/P24C16D will not respond until the write is complete (see Figure 5-1).

Figure 5-1 Byte Write

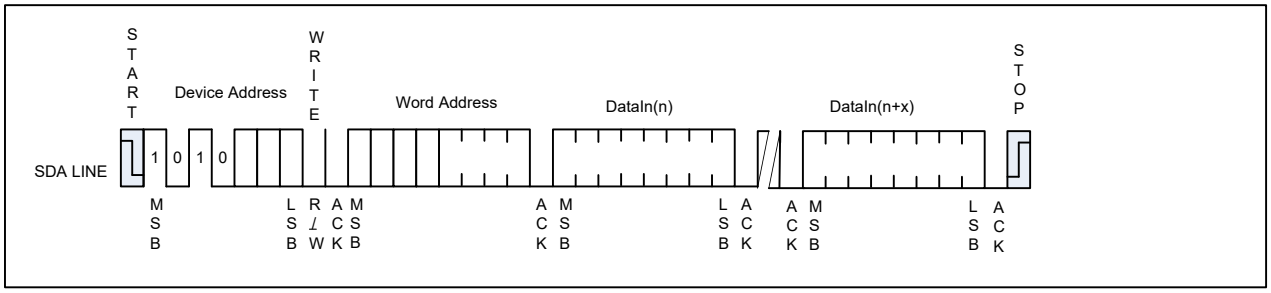

PUYA CONFIDENTIAL

5.1.2 Page Write

A page write is initiated the same as a byte write, but the master does not send a stop condition after the first data word is clocked in. Instead, after the P24C08D/P24C16D acknowledges receipt of the first data word, the master can transmit more data words. The P24C08D/P24C16D will respond with a “0” after each data word received. The microcontroller must terminate the page write sequence with a stop condition.

Figure 5-2 Page Write

The lower four bits of the data word address are internally incremented following the receipt of each data word. The higher data word address bits are not incremented, retaining the memory page row location. When the word address, internally generated, reaches the page boundary, the following byte is placed at the beginning of the same page. If more than 16 data words are transmitted to the P24C08D/P24C16D, the data word address will roll-over, and previous data will be overwritten. The address roll-over during write is from the last byte of the current page to the first byte of the same page.

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

5.1.3 Acknowledge Polling

Once the internally timed write cycle has started and the P24C08D/P24C16D inputs are disabled, acknowledge polling can be initiated. This involves sending a start condition followed by the device address word. The read/write bit is representative of the operation desired. Only if the internal write cycle has completed will the P24C08D/P24C16D respond with a “0”, allowing the read or write sequence to continue.

5.1.4 Write Identification Page

The Identification Page (16 bytes) is an additional page which can be written and (later) permanently locked in Read-only mode. It is written by the Write Identification Page instruction. This instruction uses the same protocol and format as Page Write (into memory array), except for the following differences:

- Device type identifier = 1011b
- Address bit A7~A6 must be ‘00’.
- Address bits A3~A0 define the byte address inside the Identification page. If the Identification page is locked, the data bytes transferred during the Write Identification Page instruction are not acknowledged (NoACK).

5.1.5 Lock Identification Page

The Lock Identification Page instruction (Lock ID) permanently locks the Identification page in Read-only mode. The Lock ID instruction is similar to Byte Write (into memory array) with the following specific conditions:

- Device type identifier = 1011b
- Address bit A6 must be ‘1’; all other address bits are don’t care
- The data byte must be equal to the binary value xxxx xx1x, where x is don’t care

PUYA CONFIDENTIAL

5.2 Read Operations

Read operations are initiated the same way as write operations with the exception that the read/write select bit in the device address word is set to “1”. There are three read operations: Current Address Read; Random Address Read and Sequential Read.

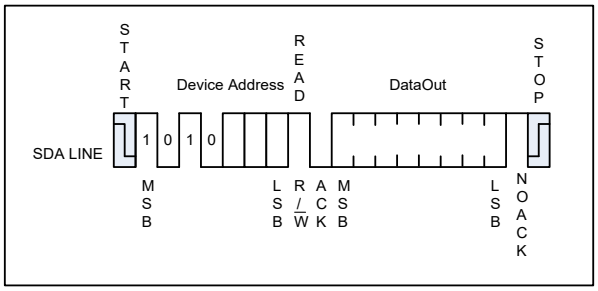

5.2.1 Current Address Read

The internal data word address counter maintains the last address accessed during the last read or write operation, incremented by one. This address stays valid between operations as long as the chip power is maintained. The address roll-over during read is from the last byte of the last memory page to the first byte of the first page.

Once the device address with the read/write select bit set to “1” is clocked in and acknowledged by the P24C08D/P24C16D, the current address data word is serially clocked out. The microcontroller does not respond with an input “0” but does generate a following stop condition (see Figure 5-3).

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

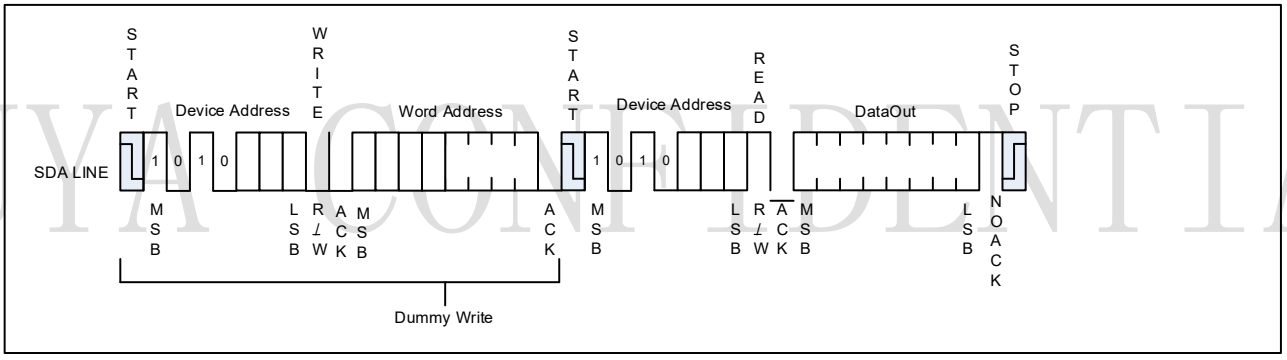

Figure 5-3 Current Address Read

5.2.2 Random Read

A Random Read requires a “dummy” byte write sequence to load in the data word address. Once the device address word and data word address are clocked in and acknowledged by the P24C08D/P24C16D, the microcontroller must generate another start condition. The microcontroller now initiates a Current Address Read by sending a device address with the read/write select bit high. The P24C08D/P24C16D acknowledges the device address and serially clocks out the data word. The microcontroller does not respond with a “0” but does generate a following stop condition (see Figure 5-4).

Figure 5-4 Random Read

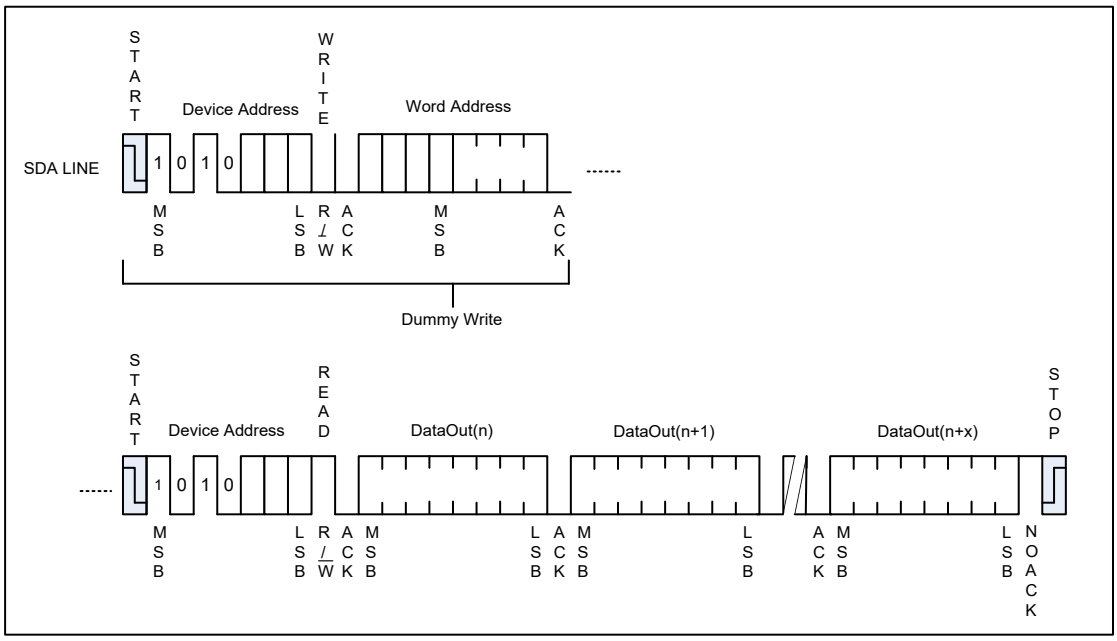

PUYA CONFIDENTIAL

5.2.3 Sequential Read

Sequential Reads are initiated by either a Current Address Read or a Random Address Read. After the microcontroller receives a data word, it responds with acknowledge. As long as the P24C08D/P24C16D receives acknowledge, it will continue to increment the data word address and serially clock out sequential data words. When the memory address limit is reached, the data word address will roll-over and the Sequential Read will continue. The Sequential Read operation is terminated when the microcontroller does not respond with a “0” but does generate a following stop condition (see Figure 5-5)

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

Figure 5-5 Sequential Read

5.2.4 Read Identification Page

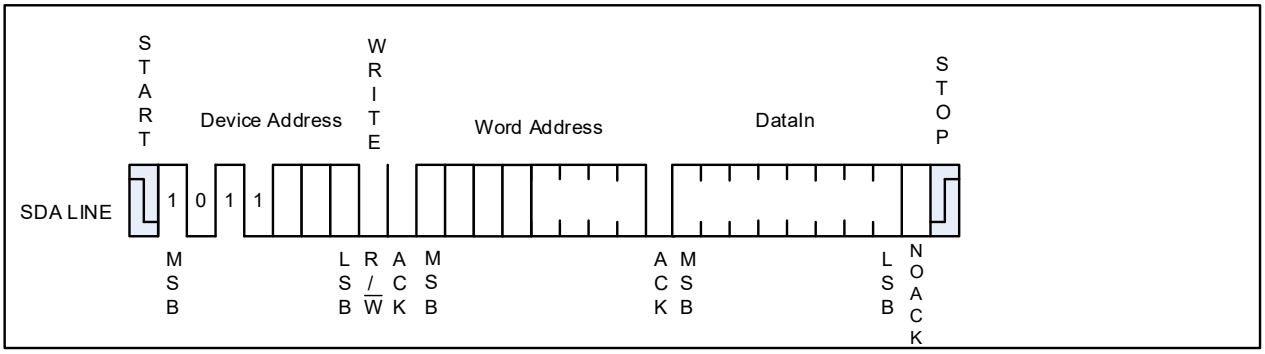

The Identification Page (16 bytes) is an additional page which can be written and (later) permanently locked in Read-only mode. The Identification Page can be read by Read Identification Page instruction which uses the same protocol and format as the Read Command (from memory array) with device type identifier defined as 1011b. The MSB address bit A7~A6 must be '00', and the LSB address bits A3~A0 define the byte address inside the Identification Page. The number of bytes to read in the ID page must not exceed the page boundary (e.g. when reading the Identification Page from location 10d, the number of bytes should be less than or equal to 6, as the ID page boundary is 16 bytes).

PUYA CONFIDENTIAL

5.2.5 Read the Lock Status

The locked/unlocked status of the Identification page can be checked by transmitting a specific truncated command [Identification Page Write instruction + one data byte] to the device. The device returns an acknowledge bit if the Identification page is unlocked, otherwise a NoACK bit if the Identification page is locked.

Figure 5-6 Lock Status Read (When Identification page locked, return NoACK after one data byte)

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

5.2.6 Serial Number Read

The Serial Number is only 16 bytes and is Read-only.

Reading the serial number is similar to the sequential read sequence but requires use of the device address seen in Table 4-1, a dummy write, and the use of a specific word address. The entire 128-bit value must be read from the starting address of the serial number block to guarantee a unique number.

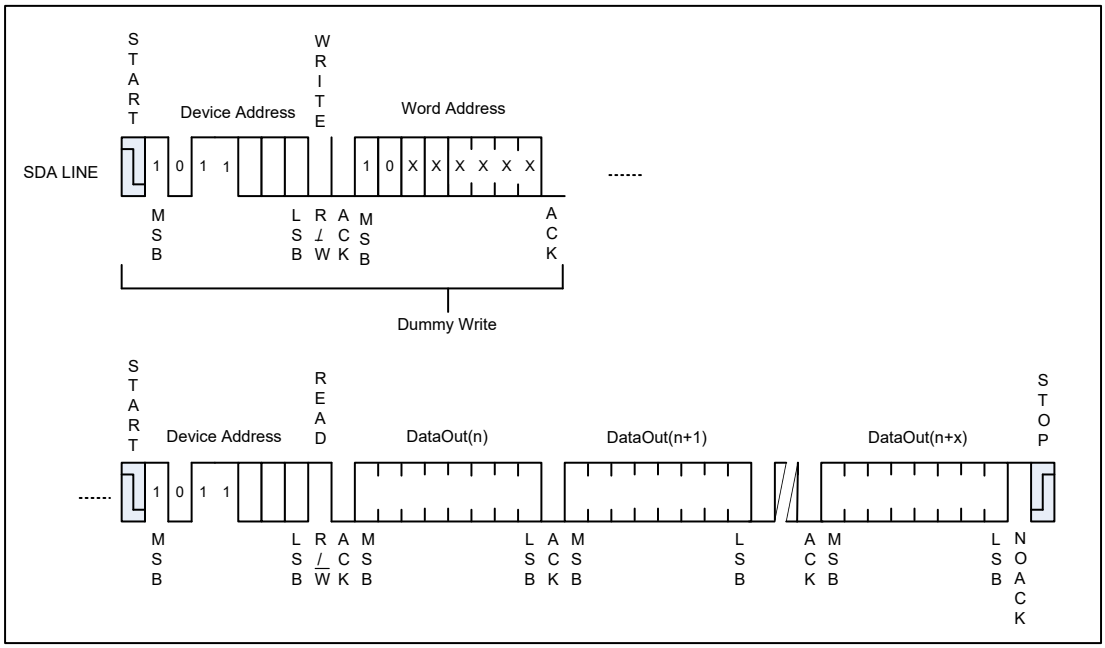

Since the address pointer of the device is shared between the regular EEPROM array and the serial number block, a dummy write sequence, as part of a Random Read or Sequential Read protocol, should be performed to ensure the address pointer is set to zero. A Current Address Read of the serial number block is supported but if the previous operation was to the EEPROM array, the address pointer will retain the last location accessed, incremented by one. Reading the serial number from a location other than the first address of the block will not result in a unique serial number.

Additionally, the word address contains a '10' sequence in bit A7 and A6 of the word address, regardless of the intended address as depicted in Table 4-2. If a word address other than '10' is used, then the device will output undefined data.
Example: If the application desires to read the first byte of the serial number, the word address input would need to be 80h.

PUYA CONFIDENTIAL

The Serial Number Read operation is terminated when the microcontroller does not respond with a zero (ACK) and instead issues a Stop condition (see Figure 5-7)

8. Revision History

Version	Content	Date
V1.0	Initial Release	2021-08-18
V1.1	Add Device Power up/Power down description	2022-03-10
V1.2	Update parameter of V_{IL}	2023-03-26
V1.3	Update figure of Package information	2024-02-20
V1.4	Update Table 4-1	2024-04-16
V1.5	(1) Update Features description (2) Update Pin Cofiguration (3) Update the Isb、I_{CC1} and I_{CC2} Description of 'Table 3-3 DC Characteristics' (4) Update Serial Number description (5) Update PDIP8 POD (6) Update SOP8(150mil) POD (7) Update SOT23-5 POD (8) Update TSOT23-5 POD	2025-06-16
